

## Levels of Significance ( $\alpha$ -alpha)

Difference between level of Significance and Confidence level.

Level of significance  $\rightarrow$  The probability with which we will reject a null hypothesis when it is true is the level of significance.

- It is denoted by  $\alpha$ .

- Probability of Type 1 error.

Confidence level  $\rightarrow$  The probability with which we will accept a null hypothesis when it is true is the confidence level.

- It is denoted by  $1 - \alpha$  (because probability sums to 1)

## Levels of Significance ( $\alpha$ value)

## Confidence level

0.01	1%	$\longrightarrow$	99%	.99
0.05	5%	$\longrightarrow$	95%	.95
.1	10%	$\longrightarrow$	90%	.90

level of significance  $\rightarrow$  Chances / by chance we accept the null hypothesis. (error chances).

Confidence level  $\rightarrow$  True chances we accept the null hypothesis.

Suppose from Z test, we get 5% or 0.05 significance level.

Level of Significance ( $\alpha$ )	Corresponding confidence interval in terms of Z value.
.01	-1.645 $\alpha$ to +1.645 $\alpha$
0.05	-1.96 $\alpha$ to +1.96 $\alpha$
.1	-2.58 $\alpha$ to +2.58 $\alpha$

- P value  $>$  level of significance, Null hypothesis is accepted.

- P value  $<$  level of significance, Null hypothesis is rejected.

### Left tail test

### Right tail test

### Two tail test

$H_1 \rightarrow$  ~~Alt~~ Alternative hypothesis.

Suppose, we have a packet of 100 chocolates.

Null hypothesis - Packet contain 100 chocolates.

Alternate hypothesis - ① If we think chocolates are less than 100 chocolates, i.e.,  $\text{count}(\text{chocolates}) < 100$  chocolates, use left tail test.

② If we think chocolates are more than 100 chocolates, i.e.,  $\text{count}(\text{chocolates}) > 100$  chocolates, use right tail test.

③ If we think chocolates are not exactly equal to 100 chocolates,  $\text{count}(\text{chocolates}) \neq 100$  chocolates, use Two tail test.
